

## K-Mix MIDI Remote Script for Ableton Live.

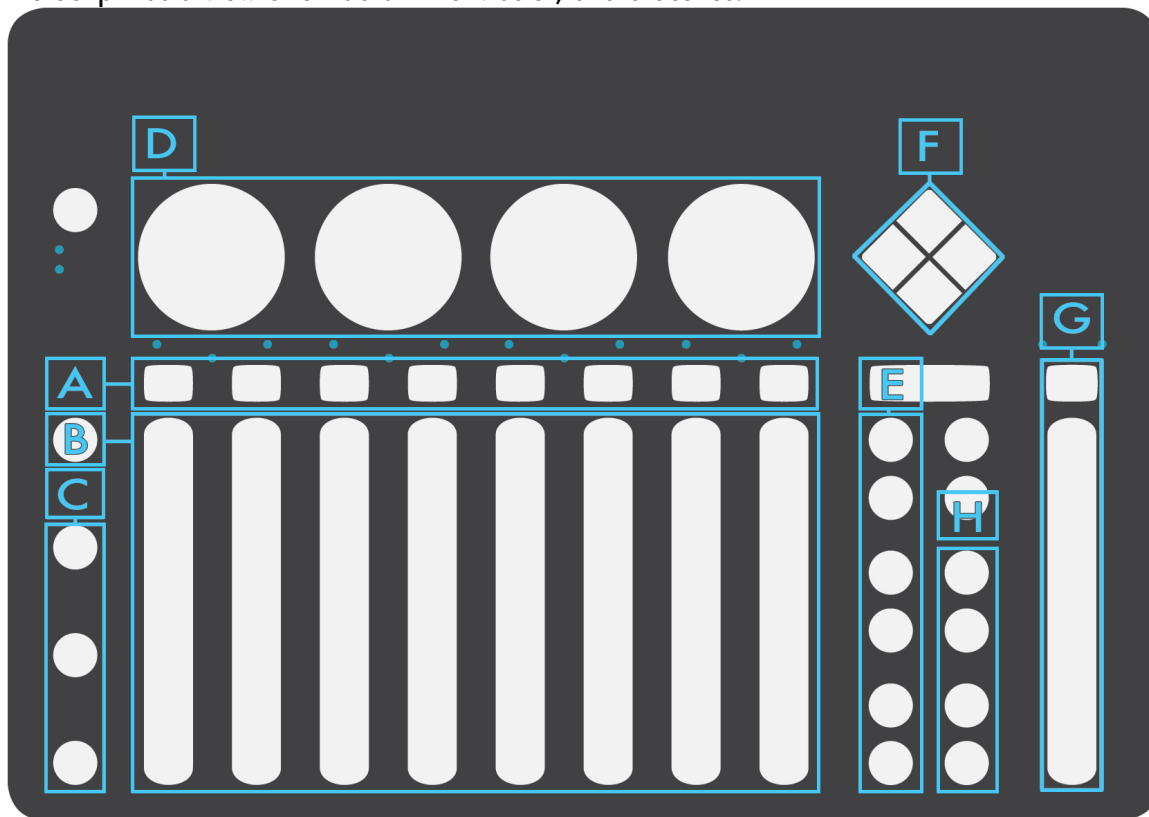

By Evan Bogunia (evanbeta@keithmcmillen.com)

### Installation:

After downloading the K-Mix\_RemoteScript repository, you'll need to place the K-Mix folder into your MIDI Remote Scripts directory:

1. Locate your Ableton Live 9 application (must be original, not alias or shortcut).
2. Ctrl-click on the .app file and select "Show Package Contents"
3. Now go into the "/Contents/App-Resources/MIDI Remote Scripts" folder.
4. Copy the "K-Mix" folder into the "Midi Remote Scripts" folder.

You can now open Live, and select the K-Mix as a Control Surface. This script will operate with the 'out-of-the-box' settings for the K-Mix. Select MIDI bank 1, and you are good to go. The Script has a view of 8 tracks + the Master, and 6 Scenes.

A. Track Select Buttons. These buttons select and focus a track.

B. Faders: These control track volume, when in Mix mode, and device parameters, when in Device Mode.

C. Mode Select Buttons: The bottom (VU) button selects VU Mode. The middle button (Fine) selects Device Mode, and the top button (Byp) selects Mix Mode. VU Mode and Mix Mode function identically, but in VU mode the faders show the volume of the eight tracks in the session highlight box.

D. Rotaries: The first rotary controls panning of the selected track, the other three rotaries control send level to A, B, and C.

E. Scene Launch Buttons: These buttons will launch the corresponding scene.

F. Session Navigator: The diamond pad will navigate the session.

G. Master fader and select button: This functions just as the track faders, except it is always in Mix Mode.

H. While in device mode, the top buttons bank through device parameters, the bottom buttons select devices on the selected track.
